

Xi Chen is an Applied Scientist on the **Pretraining Integration & Scaling Team at Amazon AGI Foundations**. He had PhD study in Computer Science at the University of Massachusetts Amherst (UMass), where he closely collaborated with professors from institutions including MIT and Oxford for years. He has also worked with research teams at UCLA and Zhipu AI (Chinese OpenAI) under the guidance of Prof. Jie Tang (Tsinghua University).

His work focuses on large-scale language model training and machine learning systems. He has hands-on experience in model design, training dynamics, data mixture optimization, and evaluation across pre-training and mid-training stages for large language models up to ~200B parameters. His doctoral research investigates event evolution within global textual media graphs, combining large-scale data analysis with methods from machine learning, information retrieval, natural language processing, network science, and computational social science.

Xi has published as a leading author in major conferences and venues including The Web Conference (WWW), NAACL, ICWSM, IC2S2, and TADA. His work bridges large-scale machine learning systems with real-world societal data, aiming to better understand information flows and global event dynamics.

Beyond research, he has demonstrated strong analytical and strategic thinking skills. He placed 3rd among more than 800,000 participants in a province-wide mathematics competition and achieved a top-50 global ranking in the strategy game Autochess among millions of players.
